TITLE: Impressions from a conference in the Ministry of Municipal Economy

PERIODICAL: Referativnyy zhurnal, Astronomiya i Geodeziya, no. 11, 1962, 3 - 4, abstract 11G24 ("Przegl. geod.", 1962, v. 34, no. 6, 276 - 277, Polish)

TEXT: An all-state conference of geodesists working in municipal economy was held in March 1962. The results of the works performed and the problems of rate fixing and prices of geodetic works in municipal economy were discussed at the conference. An exhibition was organized for the conference participants, which showed maps of several towns and instruments used for compiling large-scale maps. ✓

Title : The Boundary Layer Between the Glass and the Refractory  
Lining.

Orig Pub: Stklar a Keramik, 8, No 7, 196-199 (1958) (in Czech)

Abstract: Attack of the refractory increases the  $Al_2O_3$  content  
in the glass by 0.2-5%, leads to the formation of  
bubbles and nonuniformities in the Glass (G), and  
sometimes leads to the appearance of undesirable  
coloration. The surface of the refractory is even-  
tually covered by a thick white protective layer

AUTHOR: Kolař, Jan, Engineer

TITLE: Corrosion Tests with Emulsion Fluids

PERIODICAL: Technické noviny, No.13, March 29, 1961, p.5

TEXT: For rapid and objective evaluation of the corrosive properties of cutting fluids, Výzkumný ústav obráběcích strojů a obrábění (Research Institute for Machine Tools and Machining) developed a new method of corrosion tests which permits quantitative evaluation of the results. It is based on subjecting cast-iron or steel chip on a transparent base to the corrosive effect of the cutting fluids. The chips are spread over a certain area and the corrosive effect is expressed by the area occupied by the corrosion products which form irregular patterns on the base; these can be easily observed. The tests are made with sorted grey iron chips of 180 to 200 H<sub>B</sub> hardness produced by milling (under the following conditions: t = 2 mm, sz = 0.03 mm) and chips from the steel ČSN 12060 1 produced by cutting the material with a saw. On a thin glass plate of 80 x 80 mm a quantity of about 7 g cast-iron chips are distributed in a circle of 45 mm diameter, preferably by means of a template. For testing a sample of the cutting fluid it is

E073/E535

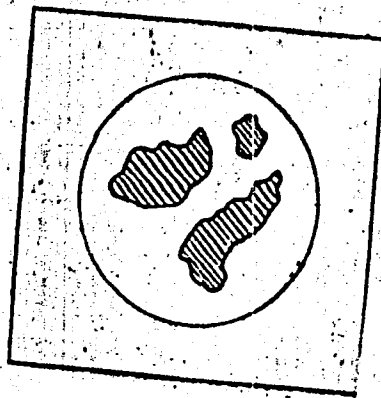

advisable to use the chosen concentration on three lots of chips. The thus prepared specimens are carefully wetted by means of a pipette with 3 to 4 ml of the emulsion and then left in the open air for about 24 hours. The first signs of corrosion usually appear after 3 hours and the corrosion cycle is almost entirely completed in 12 hours, subsequent corrosion being practically insignificant. After 24 hours the glass plate is turned over, the iron chips are shaken off and the corrosion spots evaluated. The size of the area occupied by the corrosion products is determined by a planimeter or by the grid method and its surface is calculated in percent of the total surface occupied by the chips. For the corrosion tests glass used for diascopes projectors is suitable. By means of this method the corrosion properties of some emulsion fluids was determined as a function of the fluid concentration and the results are given in a diagram in terms of the surface occupied by the corrosion products, %, as a function of the concentration, %. Results are given for electrical oil (El olej), Akvol and a soda solution (roztok sody). In Czech engineering works, corrosion tests in accordance with Czech and other specifications were not

usually carried out. However, this method is sufficiently accurate and simple for carrying out rapid corrosion tests. In addition to the graph, a sketch is included which shows the shape of corrosion patterns as seen from the bottom of the transparent glass plate. There are 2 figures.

"The Significance of Corynebacterium pyogenes as a Cause of Abortions in Cattle"

Prague, Veterinarni Medicina, Vol 8(XXXVI), No 5, October 1963, pp 301-310.

Abstract [Author's German summary, modified]: In 2,153 abortive fetuses studied during the past seven years, 524 (24.3%) were caused by bacterial infection (Corynebacterium pyogenes was found in 204 cases - 9.5% of all cases studied and 39.1% of all bacterial infections; other infections: brucellosis 8.3 and 34.3%; streptococci 2.4 and 9.4%; TB 1.3 and 5.5%; listeriosis 1.1 and 4.6%). There was a steady increase in the incidence of C. pyogenes. The incidence had a sporadic character, an enzootic course was observed only in three cases. They occurred mostly during the 6 to 8th month of pregnancy in all seasons of the year. Abortions caused frequently infertility and in some cases complications making it necessary to slaughter the animals. Gravidity disturbances caused by C. pyogenes form a serious obstacle to increasing the fertility of cattle. More attention should be paid to the hygiene during pregnancy and to artificial insemination. Thirty-two references, including 5 Czech.
